For the empowerment of the women Community Seva Centre running Seva Family Counselling Centre which is aided by Central and State Social Welfare Board.

Community Seva Centre concept of awareness

If you look up the word “awareness” in any general dictionary, you will find the only listing is as “self-awareness” (meaning “an awareness of one's own personality or individuality”). However, if you look up the word “aware”, a much wider meaning is listed, namely “having or showing realization, perception, or knowledge”.

There not usually existing a general listing of “awareness” as a unique listing, we define it to mean “unique perception and/or knowledge of self and all”.

2.5.1 Awareness as unique knowledge of self or all

The first part of awareness is as unique perception of knowledge. Examples of knowledge are science, history, society, economics, mathematics, languages and religion.

Therefore in one sense to say a person “has greater awareness”, it can mean they have greater knowledge of such subjects.

2.5.2 Awareness as unique perception of self or all

In contrast, unique perception of self or all does not require great knowledge of science, only of what a person is “feeling”. Unique perception is completely subjective.

There are some words that are especially related to this aspect of awareness as they are most commonly used to mean the same thing. These are: Mind, Consciousness, Ethereal, Ether, Being and Self.

2.5.3 Greater perceptual awareness

Unique perception of all is considered a “higher” form of awareness and is a basic concept associated with ideas such as meditation, astral travel, telepathy, spiritual channeling and healing.

2.5.4 Self-aware life

The rational reason that awareness is not usually listed as an independent object in the dictionary is not because the concept does not exist, but because the concept does not exist in reality.

The only evidence of awareness is self-aware lifeforms such as the human being and other higher-order species on planet Earth. There is simply no evidence awareness existing independent of a living thing.

2.5.5 The idea of Awareness as an independent quality “in theory”

Even though awareness as an independently existing quality is considered impossible, it still exists as a theoretical idea. Awareness as an independent quality is an idea.

The Concept of existence

Any reasonable sized dictionary contains a rich array of definitions for the meaning of existence. Of the list, the key ones are:

Absolute Concept-the theoretical state or fact of being independent of human consciousness in contrast with nonexistence;

Universal concept-being with respect to a limiting condition or under a particular aspect;

Absolute set-the totality of existent things ;

Reality of observation-reality as opposed to appearance ;

Reality of experience-reality as presented in experience ;

Unique life-a particular being ;

Life-sentient or living being : life;

Quality of life-the manner of being that is common to every

mode of being ;

Awareness-continued or repeated manifestation.

The concept of a dream

When someone says to you the word dream, the first thing you probably think of is your most recent memorable dream or thought. Dream is what we do when we sleep. Daydreaming is what we do when we are awake, but not focused on the reality before us.

Dreams are intriguing and common to every human being and advanced lifeforms. Dogs dream, cats dream, even fish dream. What they dream of, we can't really say for sure. But as a human, what you dream about you can describe, if you choose to say and remember.

The images of dreams are a major part of the fascination of dreams and day dreaming. There are great many interesting web sites that provide marvelous possible reasons for thousands of possible dream images. At the end of the day, the reason for the images in your dreams are ultimately unique to you.

What is important to consider about dreams, day dreams and even thinking itself is that all three adhere to certain basic rules of structure.

2.7.1 The concept of dream structure

The idea that a dream, or thought has structure is itself a radical idea that takes some getting used to.

This is because for most of our lives we have probably never given thought a thought. We take our minds for granted. They exist, so that it. The idea that when we think a thought, that thought represents a dimensional boundary (dream boundary) within which a reality exists for the length of that thought exists is an alien concept to our general sensibilities.

2.7.2 The idea that thoughts and dreams are just "programs"

For most of the 20th century, modern societies have been told to consider thoughts and dreams as just effects of the machine of consciousness. Because branches of human analysis (psychology, psychiatry) are now able to explain so much of the human personality

and physical process, most of us do not give the very notion of structured consciousness a second thought.

By explaining human thoughts and dreams as processes, science is able to place these things in boxes without need to consider any structural or dimensional aspect to the phenomena of thinking, the “being of consciousness”.

Yet for thought to exist, it requires structure. The same structure that applies to any dimensional universe.

2.7.3 The dimensional structure of thought and dreams

Thoughts and dreams are made of the same thing. The same theoretical rules that apply to the creation of any dimension. The only difference to human dream dimension and universal dimension is that human dream dimension only exists for a few moments before collapsing from poor structure.

The concept of Unique Collective Awareness (UCA)

UCA (unique collective awareness) is an idea that the base of all things is awareness and that this awareness might be described by the existence of the universe of all things (collection of unique objects). In other words, everything has awareness and everything is made of awareness in motion.

UCA is also a statement that represents a paradox– something that intrinsically is illogical– (a statement that makes no logical sense). For something to be unique, it cannot then also be but part of a collection. For is a set of infinite unique objects unique in itself?

Unique Collective Awareness therefore represents a supremely contradictory statement in itself– as it defies the current laws of thinking to suppose something to be both unique and part of a collective uniqueness at the same time.

2.8.1 The importance of paradox and the model

As this book shall seek to outline, this suprem
